1 Initial CPTs
S0: >= 5 spatially dispersed positions (same for all policies)
2 AI prediction
TabPFN + graph
ln qc on 24 cells, 2-8 m
low-qc thickness H(x)
3 Choose next batch
a = 0.5 U + 0.3 D + 0.2 S
U GP std, D disagreement, S distance; 2 groups
4 Stop rule met?
stability, support error, GP uncertainty, coverage; >= 9 CPTs, 2 rounds running
yes
5 Economics
CPTs, field + wait days, alpha = 1 time transfer, net owner benefit
no: reveal the batch, update the site context, predict again
Information boundary: hidden audit CPTs (A) never enter prediction, selection or stopping
S0 initial
C candidate pool
A hidden audit (~20%)
N_full = |S0 + C| (audit excluded); near-duplicate groups always move together
Independent audit after the stop
pass / false early stop / no early stop
compared with B_full on the same A
